

## **Unit 12 – Reflections**

Unit 12 was the last unit of the Secure Software Development module. During this week I had to gather all my evidence, reflections, and more obtained throughout the module and code my e-portfolio using HTML and CSS.

Additionally, I read about the Monolithic and Microservices/Microkernels argument.

Generally, having almost reached the end of the Secure Software Development module, I feel overwhelmed with the number of risks a software can suffer. It is unimaginable to think how secured well-known software should be to avoid data breaches.
