

Unit 1 – Reflections

During Unit 1 of the Secure Software Development, I went through all the units of the module to start organising myself for its requirements. Additionally, I started working on my first collaboration discussion post where I had to select one weakness identified by OWASP and create a UML diagram showing the steps that led to this weakness. Prior to my Secure Software Development module, I worked with the Object-Oriented Programming module where we had many UML assignments, therefore, the SSD module helped me to put into practice what I had learnt.

Additionally, during the first unit, I got assigned to a study group as our assignments would be completed in groups.
