Unit 11 – Reflections

Unit 11 was one of the busiest weeks of the module. The deadline for our coding output was approaching and we were trying to complete our code the soonest possible. The final assignment was split into three parts: the Python code, the CSS code for the web application and the Readme file. Each member provided ideas and tips for all three aspects; however, every member had their own strengths and prior experiences.

During this unit, I also studied the future trends of the computing department such as IoT, Cloud, Big Data, 5G networks, etc. I find the future technologies to be extremely interesting and I can't wait to see them widely adopted. In my bachelor's thesis in financial management, I chose to research and write about the future of banks and their adoptions of novel technologies, therefore, undoubtedly, this unit was my favourite. It is breathtaking to think of all possible applications of these technologies.
