Unit 10 – Reflection

Unit 10 was focused on software quality monitoring in Python using Python linters.

During this module, I completed an ePortfolio activity based on a 1977s article written by McCall, Richards & Walters.

For the assignment, I had to compare the major differences in software quality between 1977 and today.

Furthermore, during this week I started the preparation for the upcoming presentation next week.

Overall, unit 10 was a wholesome week, but at the same time, I was feeling stressed to complete everything on time for the next week's assignment.
