Unit 4 – Reflection

In Unit 4 I researched whether the Internet we have today would be better if it was based on the ISO/ OSI 7-layer model rather than TCP/IP. This research was mostly focused on the history of both models and how despite the broad acceptance of the ISO/ OSI 7-layer model, the TCP/IP came to prevail.

I also prepared my post for my second collaborative discussion about the scanning performed in Unit 2, where I made a summary of my scans. Overall, it was a fun and not so demanding week.

Team Meetings Notes:

- We discussed the network fundamentals, and we shared our prior knowledge regarding the ISO/OSI and TCP/IP protocols.
- Our AWS server stopped working and we tried to correct it, however, the error was not from our side.
- We further analysed some results from our network scans.
